

YOLO Environment Setup

YOLO Environment Setup

This chapter applies to building the environment yourself using the official RDK image. If you are using the YAHBOOM version of the image, you can ignore this tutorial.

1. One-Click Installation

The following command automatically installs the environment required for yolov26. Just wait patiently.

```
pip install -U ultralytics
```

After the installation is complete, restart the RDK development board.

```
sudo reboot
```
